Brake, then downshift

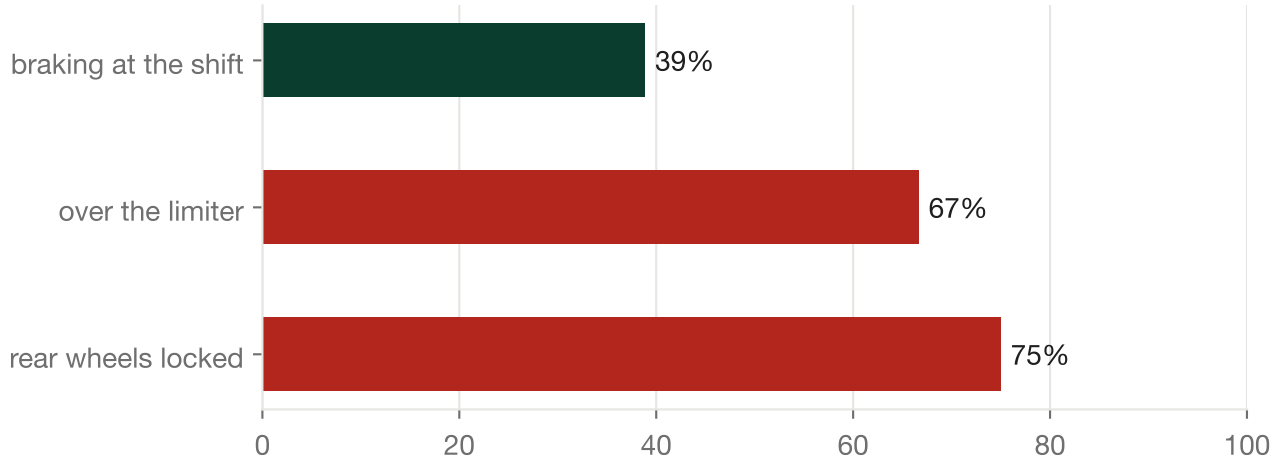

What the data says. 36 downshifts. You were on the brake within a quarter second of the shift in 39% of them. 24 of 36 forced the engine above the 6,800 limiter in the new gear, and the rear wheels locked briefly after 27. The 3 to 2 changes were done at about 113 km/h, which asks 2nd for about 7,894 rpm. That is the shunt you feel.

What to do. Brake first, and keep a little brake on through the change. Shift once the speed suits the lower gear, then let the clutch out smoothly. With the new gearing that means 2nd below about 105 km/h and 3rd below about 130. The instructor's 'gear down early' means finish your braking early, not change gear while you are still fast.

Each dot is one downshift. Above the red line, the gear change forces the engine past the limiter.

Share of downshifts. Aim: braking at the shift near 100%, the other two near zero.

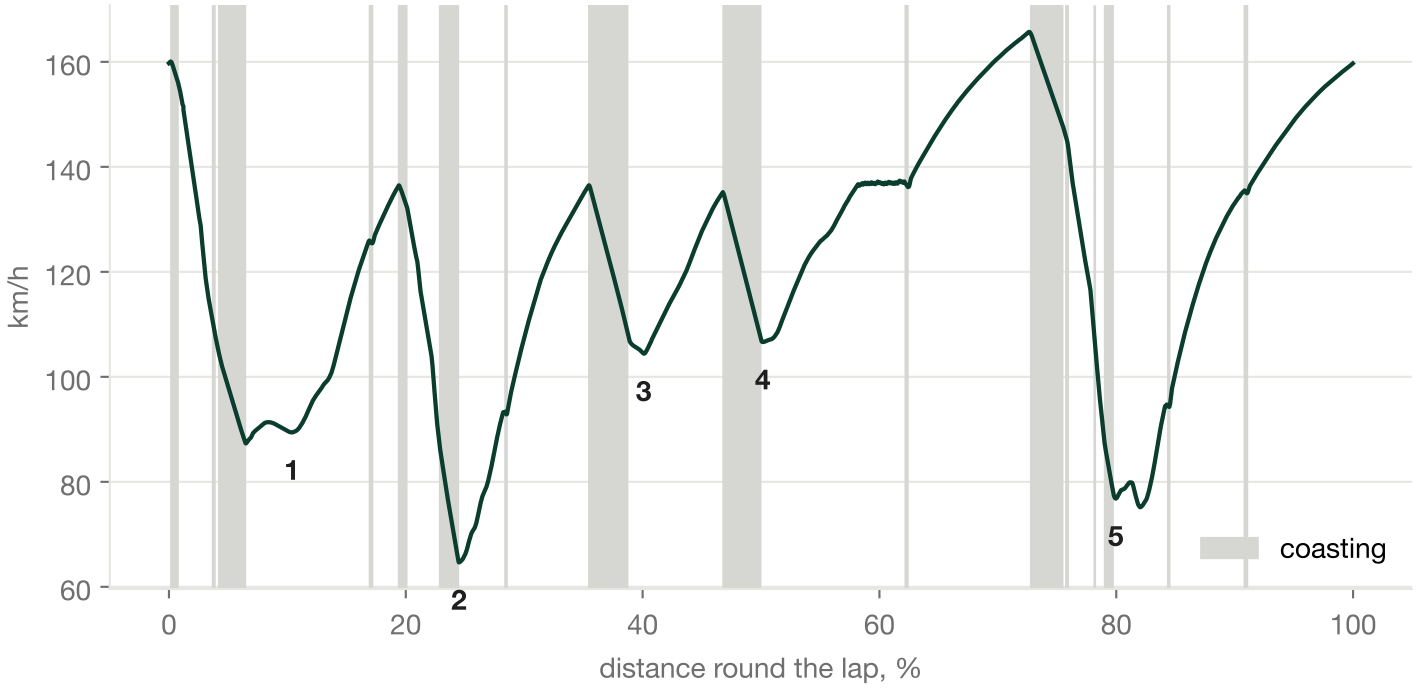

Killarney in Assetto Corsa, the Birkin twin, 18 October 2026. Session 9, best lap 1:43.546. Gearing at the time: 2nd 1.97, 3rd 1.37.

Stop coasting

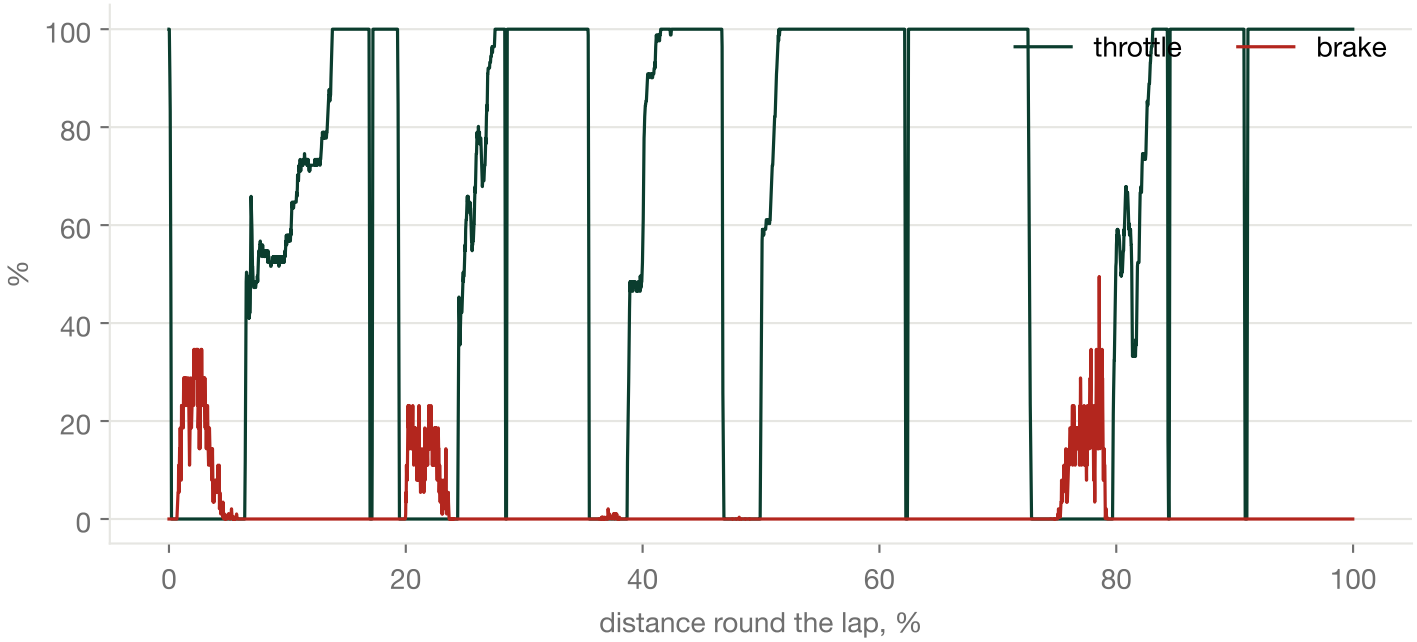

What the data says. 21% of your driving time was spent coasting: off the throttle and off the brake. In a Seven that is lost time, and it is what made the downshifts harsh: the car slows on its own while you wait, then the clutch comes out with nothing settling the car.

What to do. Every corner is throttle, then brake, then throttle again. Go straight from one pedal to the other. Brake firmly at the start, ease off as you turn in, and pick up the throttle as you unwind the wheel. On the trace below the grey bands are coasting; make them as thin as possible.

Best lap 1:43.546: speed, with coasting shaded and corners numbered from the start line.

Throttle and brake. Between the two there should be no gap.

Killarney in Assetto Corsa, the Birkin twin, 18 October 2026. Session 9, best lap 1:43.546. Gearing at the time: 2nd 1.97, 3rd 1.37.

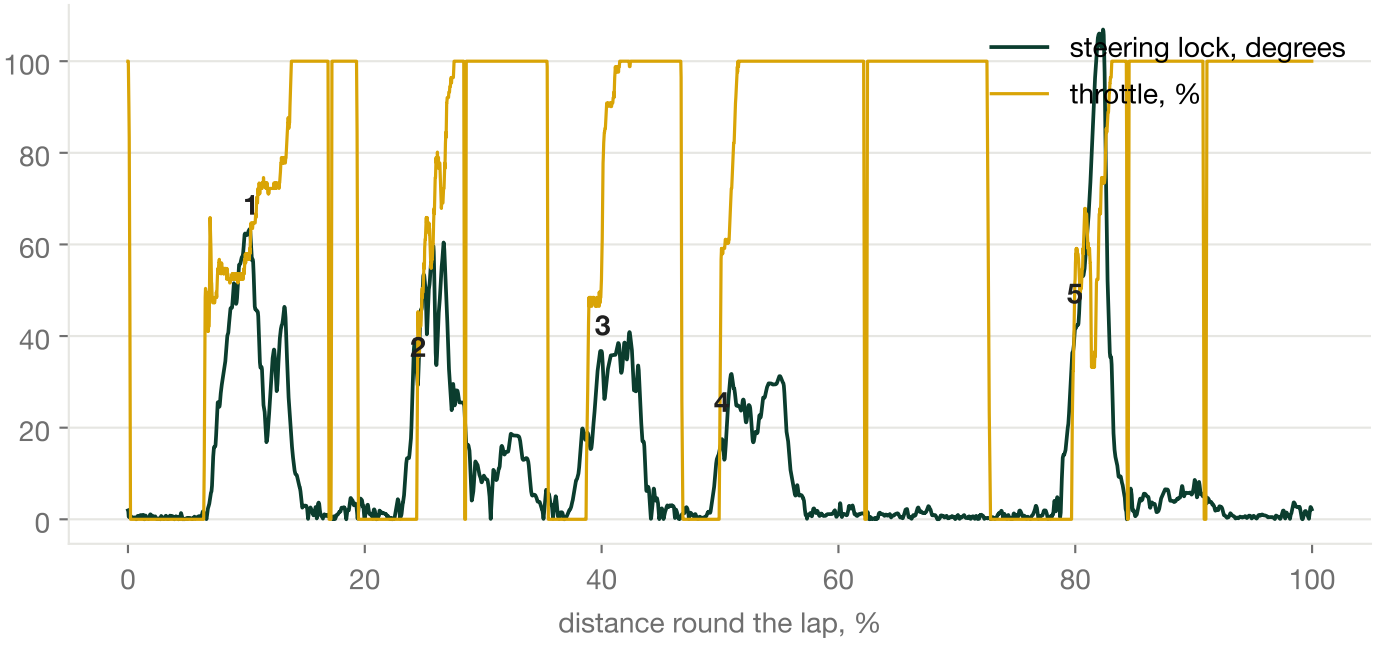

Open the wheel, let it run

What the instructor said. You turn too much; open up the steering wheel and use the car's power to push it out of the turn.

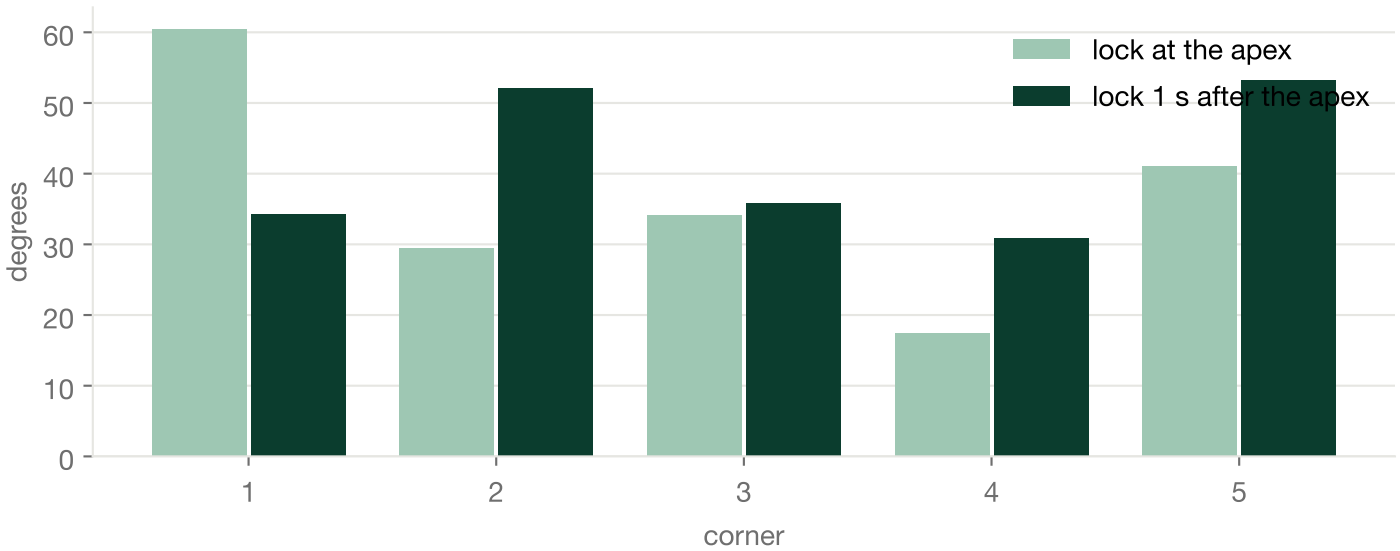

What the data says. At the slowest point of each corner you had about 34 degrees of lock (median). One second later you were still holding about 36 degrees with 72% throttle, and it took about 5.6 s to unwind most of the lock. In 4 of 5 corners you had more lock a second after the apex than at it: you were winding on lock while adding power. That is exactly what the instructor saw.

What to do. Turn in once, decisively, then from the apex let the wheel come back as the throttle goes on: hands unwind and right foot presses together. If you need more lock to hold the line, you are too fast at the apex.

Steering and throttle together. On exit the green should fall as the yellow rises.

Per corner. The dark bar should be well below the light one.

Killarney in Assetto Corsa, the Birkin twin, 18 October 2026. Session 9, best lap 1:43.546. Gearing at the time: 2nd 1.97, 3rd 1.37.

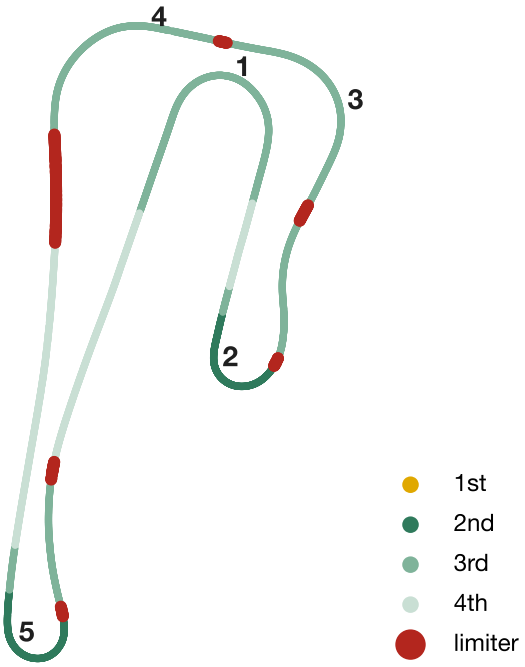

Gears for this track

What the data says. You were on the limiter in 2nd at two places a lap: out of corner 2, the hairpin, by about 105 km/h, and out of corner 5, the last slow corner before the main straight, by about 117 km/h.

What changed. 2nd is now 1.60 (was 1.97) and 3rd 1.30 (was 1.37), so 2nd holds through both exits.

What to do. Stay in 2nd through those two exits and change up once, cleanly, at about 6,300 rpm. Fewer changes means fewer chances to get a downshift wrong.

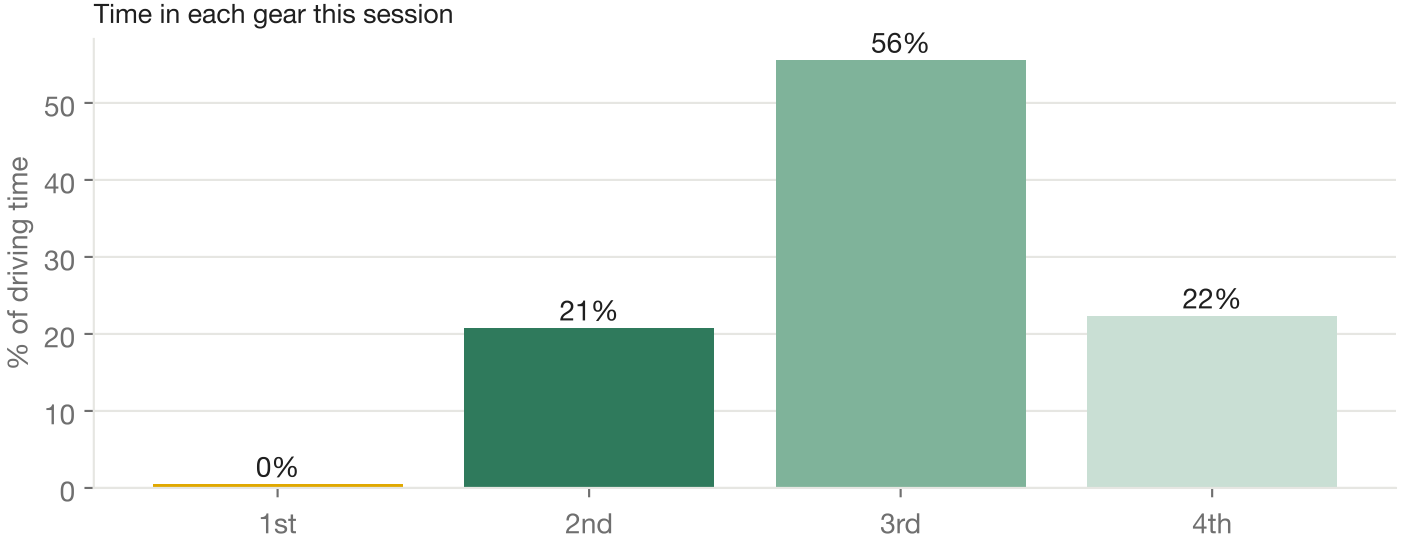

Gear round the lap, limiter in red

km/h at the 6,800 limiter

gear	before	now
1	52	52
2	97	119
3	140	147
4	191	191

Time in each gear this session
